A Brief Overview

The section talks about radio mostly and how media is extended media rather than mass media. It is extended because it extends the audience to more people, but it inevitably distorts the message. The greatest drawback with extended media is that there is no immediate feedback through body language, for example. The reason the author talks about this is that we need to understand the positives and negatives of mass media - as we are in the Technological age, we must never give up person-to-person sermons or evangelism.

Key Points

- 1) When I learned that radio does not allow for immediate feedback, like body language, I thought it was obvious, but at the same time, I thought it was a “Ah ha” moment because if I make a YouTube video, it is hard for me to find out what people think of me as they watch me.
- 2) Mass media is also known as extended media in this book because extended means that the media was brought to a greater audience. This brought greater clarity to the word, “media,” because usually it’s purpose is to reach a greater audience and be more convenient.

Personal Application

I believe this is a very important topic because we are in the Technological Age right now. AI is booming and YouTube is maybe one of the most popular websites on the planet. With AI, we can probably make a sermon with a click of a button and not need any human interaction. However, human interaction is what makes social beings living, and thus, we cannot give up person-to-person sermons and interactions. The adjustment I need to make with my ministry is to never give up in-person meetings. I need to improve my communication by

receiving feedback if I am to make YouTube videos - by asking the audience, or by reading the ocmments.
